IST 195 Recitation Lab
Week 7: Cloud Computing

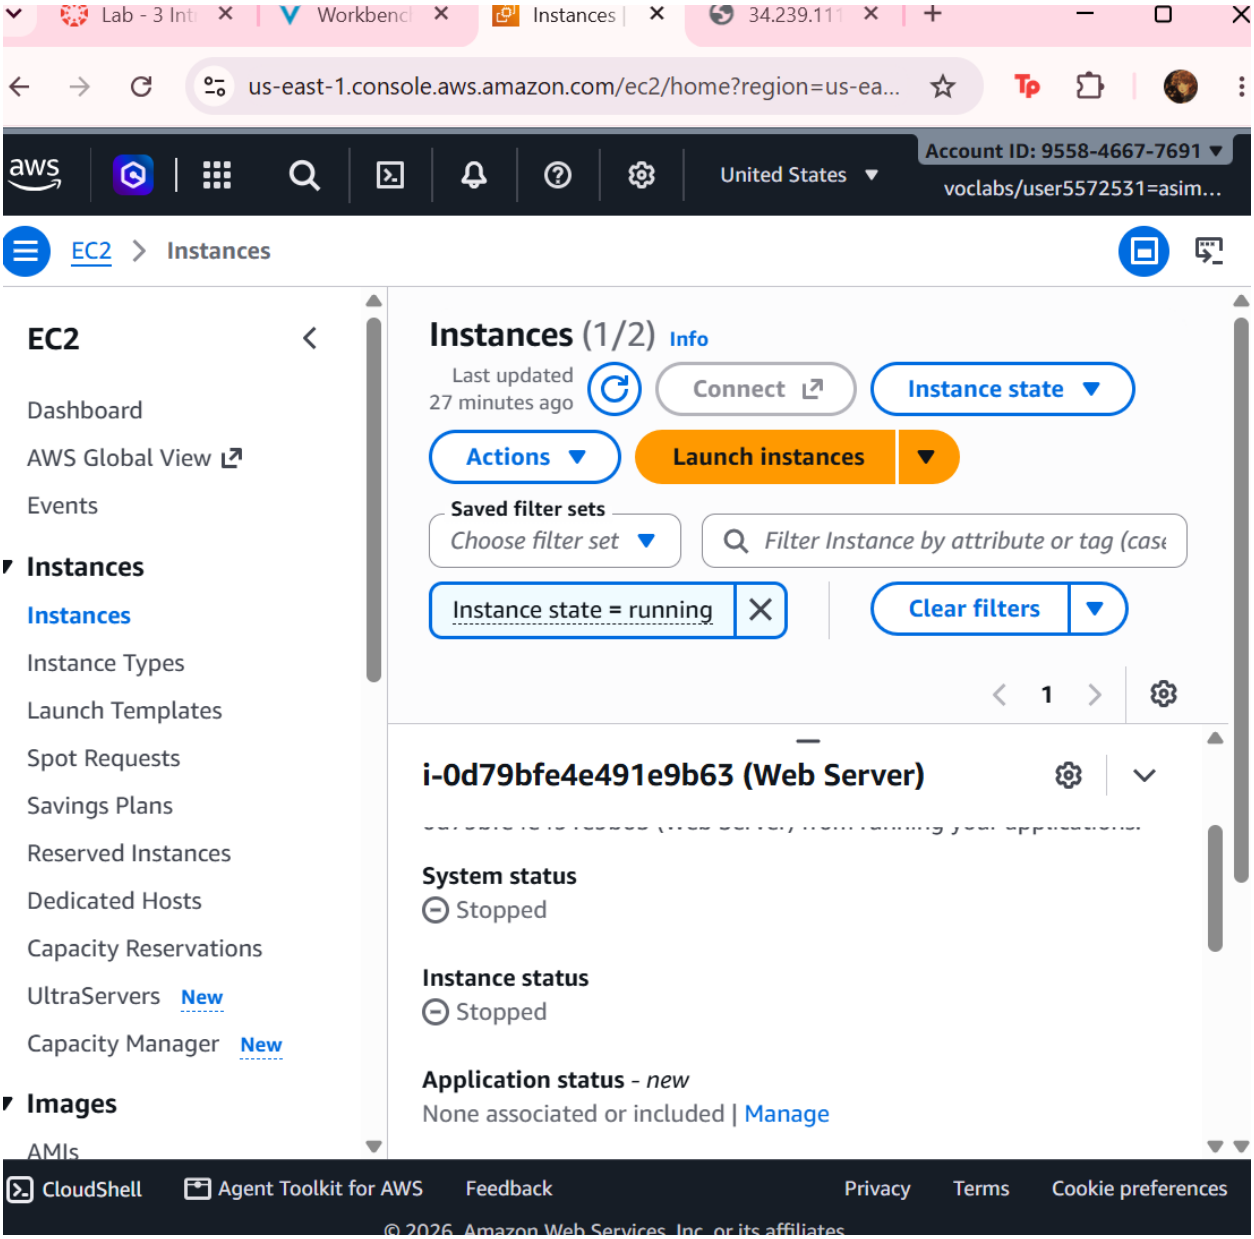

1. **Paste your Public DNS (IPv4) and IPv4 Public IP you copied during the lab.**

   Public DNS (IPv4): ec2-34-239-111-57.compute-1.amazonaws.com
   IPv4 Public IP: 34.239.111.57

2. **Paste a screenshot of your final webpage. In order to receive credit, you MUST include the URL bar in your screenshot.**

3. **Paste a screenshot of your EC2 dashboard showing your stopped instance.**

4. **Explain the concept of cloud computing and its impact on the organization of IT systems in the workplace. Try to include real-life examples of how organizations use cloud (E.G. Netflix uses AWS for storing and serving videos to customers). Minimum six sentences.**

   Cloud computing is the ability to utilize a wide variety of IT resources on-demand. With cloud computing you can access computing power, storage, databases, and other IT resources over the internet. Cloud computing uses pay-as-you-go pricing. Before cloud computing, IT teams maintained all information technology aspects of a company. With the addition of cloud computing, all these things are rented over the internet and the maintenance is done externally. An example of an organization

that uses the cloud is Microsoft. Microsoft allows you to store your OneDrive to the cloud so you can access your files from any device.

5. **In a paragraph, explain Amazon Web Services. Minimum four sentences.**

   Amazon Web Services provides on-demand cloud computing platforms and APIs. Its users include individuals and companies. Users pay for the resources they use whenever they host servers through AWS. Types of servers include EC2, which are virtual servers.

6. **Go to "aws.amazon.com", click on the "Products" tab and research another cloud-based product that Amazon offers. Explain in detail the product you have selected and its potential benefits. Minimum six sentences.**

AWS offers a service called "Experience-Based Acceleration (EBA)" which is a program that allows customers to move their data onto the cloud using "outcome-focused transformation methodology." There are some companies that do not yet operate out of the cloud. It can be difficult to begin the transformation to using the cloud instead of your own IT infrastructure. This service aims to make that transformation easier. It allows companies to "migrate at scale and modernize their business." The service also emphasizes learning cloud proficiency. This is important because migrating to the cloud is just the first step. Although the customers no longer have to maintain their own IT infrastructure, they still need to understand how to operate the cloud so maximize what they get out of it.
